### Operation Description

EC2306 step-up DC/DC converter charges energy in the inductor when  $Lx$  Transistor is on, and discharges the energy with the addition of the energy from input power source thereto, so that a higher output voltage than the input voltage is obtained. Following is the operation diagram.

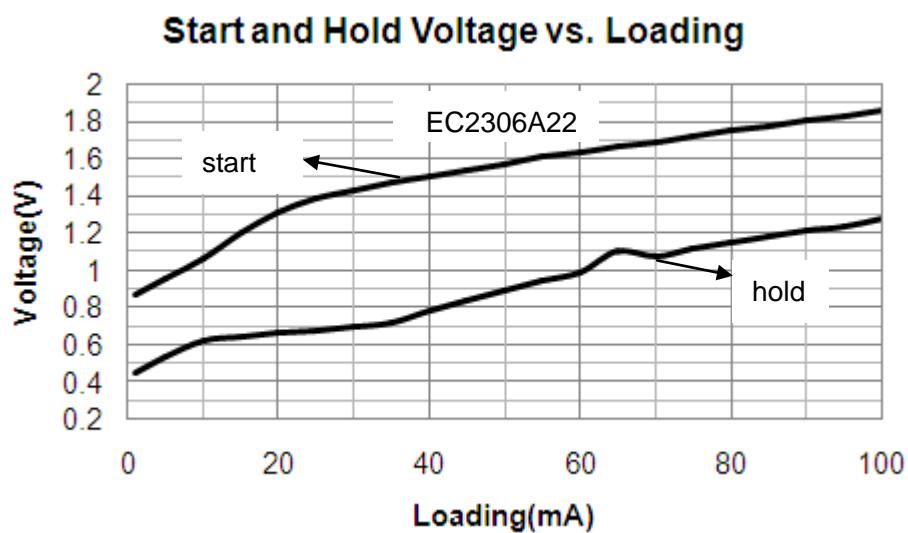

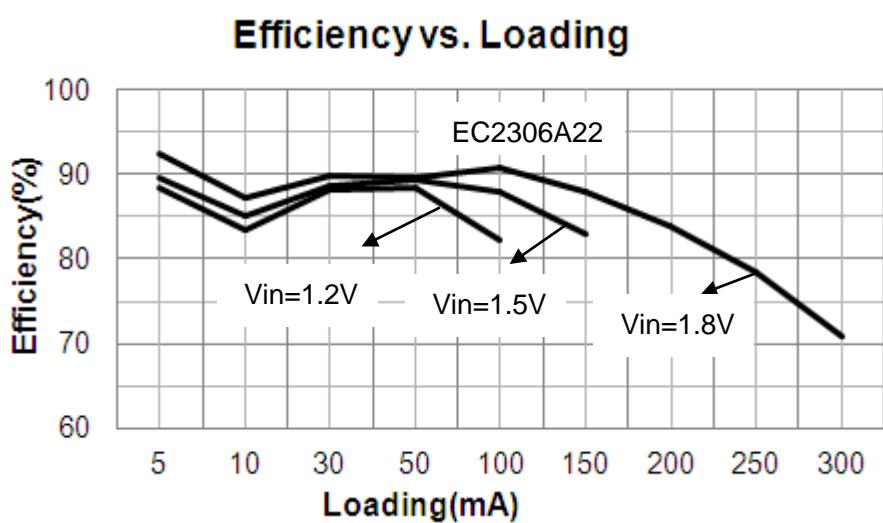

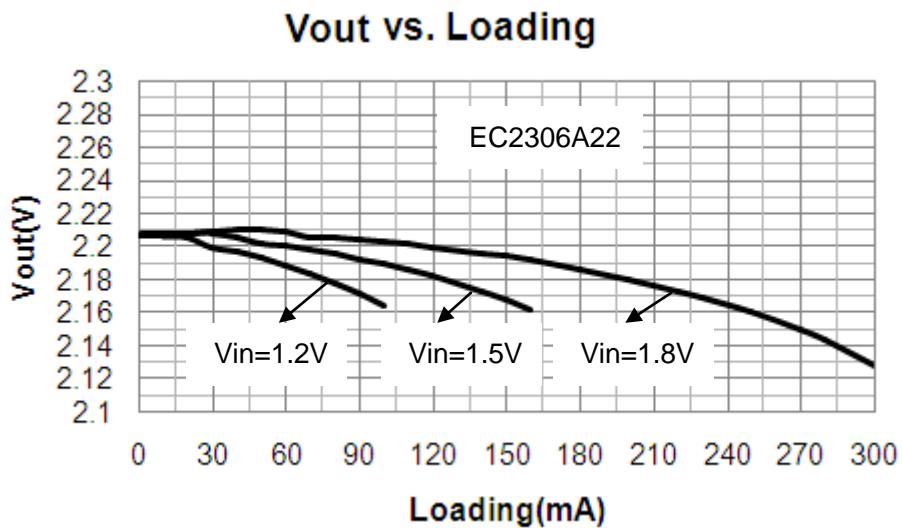

Switching DC/DC Step up Converter operating process

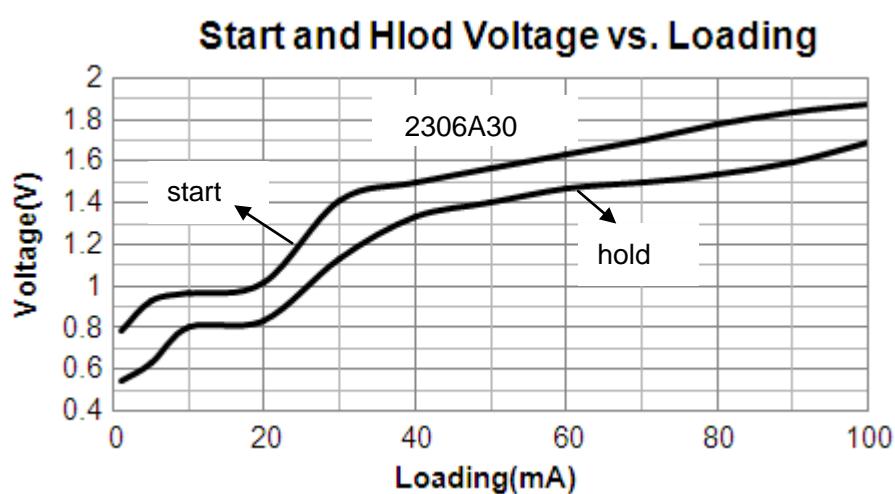

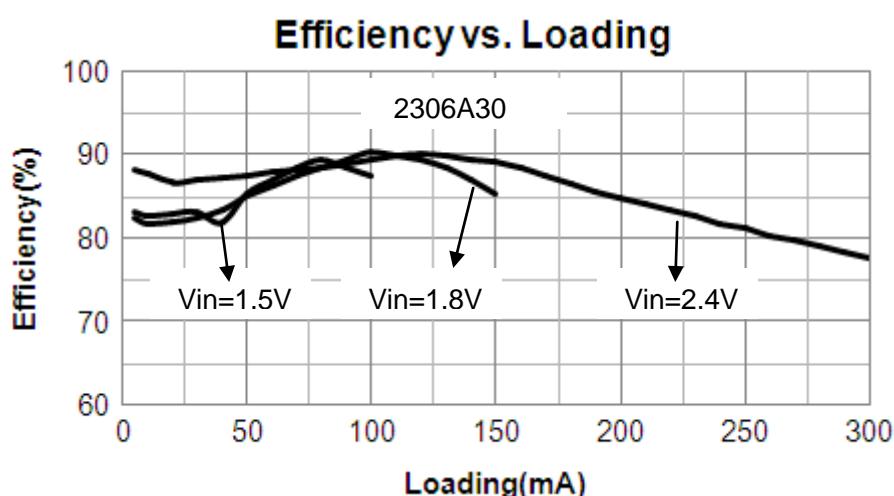

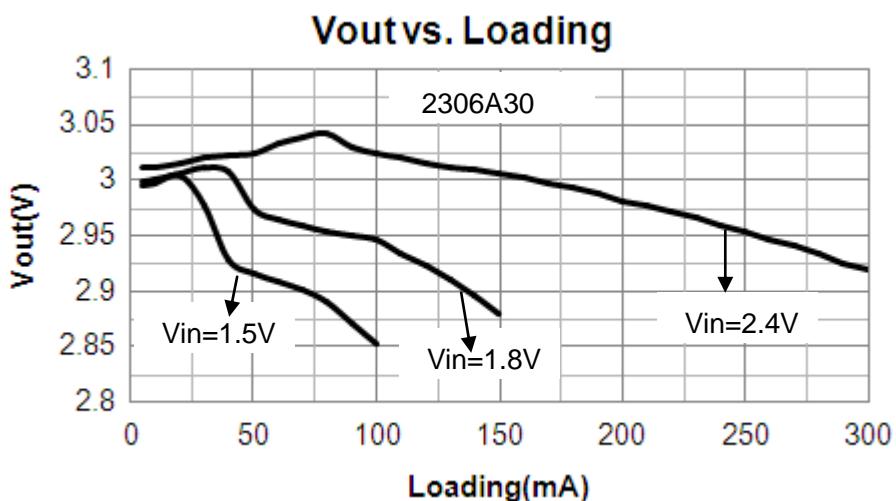

- PCB Layout:
  - ✧ Set external components as close as possible to the IC and minimize the connection between the components and the IC. In particular, when an external component is connected to  $V_{OUT}$  Pin, make minimum connection with the capacitor.
  - ✧ Make  $V_{ss}$  pin sufficient grounding, otherwise, the zero level within IC will varied with the switching current. This may result in unstable operation of IC.
